

ESG Report

International Sustainability Standards Board

Test's Organization

Annual Report • 2024

ISSB Compliant

Executive Summary

Test's Organization reports total greenhouse gas (GHG) emissions of 1,851 kilograms of carbon dioxide equivalent (kg CO₂e) for the 2024 reporting period, measured in accordance with the International Sustainability Standards Board (ISSB) framework and IFRS S2 Climate-related Disclosures. Our inventory encompasses direct operational emissions and energy consumption across defined organizational boundaries, establishing a quantitative baseline for climate-related performance monitoring and strategic risk assessment. The emissions profile reflects Scope 2 indirect energy emissions of 1,449 kg CO₂e as the primary contributor, representing approximately 78% of our total carbon footprint, alongside Scope 1 direct emissions of 402 kg CO₂e from controlled operational activities. Scope 3 value chain emissions are reported as zero for the current period, reflecting either limited upstream and downstream operational activities or the exclusion of immaterial emission categories from the current measurement boundary. This data configuration informs our assessment of climate-related transition risks and opportunities within our specific operational context. As a low-carbon intensity organization, Test's Organization maintains focused governance over energy consumption patterns while monitoring for material changes in value chain activities that may warrant expanded disclosure under evolving ISSB requirements. Our climate strategy prioritizes operational efficiency and emissions reduction initiatives aligned with our measured environmental impact, ensuring continued compliance with international sustainability reporting standards and supporting stakeholder transparency.

Emissions Overview

SCOPE 1 - DIRECT EMISSIONS

402

kg CO₂e

SCOPE 2 - INDIRECT (ENERGY)

1,449

kg CO₂e

SCOPE 3 - VALUE CHAIN

0

kg CO₂e

TOTAL EMISSIONS

1,851

kg CO₂e

Test's Organization reports total greenhouse gas (GHG) emissions of 1,851 kilograms of carbon dioxide equivalent (kg CO₂e) for the 2024 reporting period, prepared in accordance with the GHG Protocol Corporate Standard and the International Sustainability Standards Board (ISSB) IFRS S2 Climate-related Disclosures. The emissions inventory comprises Scope 1 direct emissions of 402 kg CO₂e generated from operational activities under the organization's control, and Scope 2 indirect emissions totaling 1,449 kg CO₂e associated with purchased electricity and energy consumption. Scope 3 value chain emissions are reported as zero, reflecting either an assessment of immateriality based on current operational boundaries or the exclusion of supply chain emissions pending establishment of comprehensive data collection methodologies across our value chain. Our emissions profile indicates that purchased energy represents the predominant source of climate impact, with Scope 2 accounting for approximately 78% of total reported emissions, while direct operational emissions constitute 22% of the carbon footprint. The current reporting boundary excludes value chain emissions categories 1-15 as defined by the GHG Protocol Corporate Value Chain Standard, consistent with the principle of relevance and our determination that these emissions do not materially influence stakeholder decision-making at this stage of our climate disclosure maturity. We recognize the importance of comprehensive Scope 3 assessment and are implementing enhanced data collection frameworks to evaluate upstream and downstream emissions as our measurement and verification capabilities evolve.

Governance

The Board of Directors maintains ultimate oversight of climate-related risks and opportunities, including direct accountability for the integrity of greenhouse gas (GHG) emissions disclosures in accordance with IFRS S2 requirements. During the 2024 reporting period, governance protocols ensured the accurate measurement and verification of Test's Organization's carbon footprint, resulting in total disclosed emissions of 1,851 kg CO₂e. This inventory comprises 402 kg CO₂e in Scope 1 direct emissions from controlled sources and 1,449 kg CO₂e in Scope 2 indirect energy-related emissions, with Scope 3 value chain emissions currently reported at 0 kg CO₂e. Management executes the Board's climate oversight mandate through established protocols for emissions data collection, calculation methodologies aligned with the Greenhouse Gas Protocol Corporate Standard, and internal controls ensuring the reliability of disclosed metrics. The governance framework assigns specific accountability for monitoring energy consumption patterns underlying Scope 2 figures and direct fuel usage contributing to Scope 1 totals, with regular reporting lines to the Board on performance against the 1,851 kg CO₂e baseline. Governance processes integrate these quantitative emissions metrics into strategic risk management and oversight functions, ensuring that material climate-related data informs capital allocation and operational decision-making. The governance body reviews the organizational boundary and scope of emissions calculations annually, with current disclosures reflecting operational control approaches that define the inclusion of Scope 1 and Scope 2 sources while maintaining transparency regarding the Scope 3 value chain assessment.

Test's Organization reports a total greenhouse gas (GHG) footprint of 1,851 kg CO₂e for the 2024 reporting period, measured in accordance with the GHG Protocol Corporate Accounting and Reporting Standard. The emissions profile comprises 402 kg CO₂e in Scope 1 direct emissions and 1,449 kg CO₂e in Scope 2 indirect emissions from purchased energy, reflecting the organization's current operational energy dependencies. Scope 3 value chain emissions are reported at 0 kg CO₂e, representing a baseline assessment where upstream and downstream quantification remains under development; the organization recognizes this data limitation and prioritizes comprehensive value chain mapping to identify material categories requiring measurement in subsequent reporting cycles under IFRS S2 Climate-related Disclosures. This minimal carbon intensity baseline informs Test's Organization's strategic approach to climate resilience and transition planning. While absolute emissions remain below thresholds requiring immediate intensive abatement, the Board integrates these metrics into capital allocation frameworks and risk management processes to maintain low-carbon operational trajectories. The disparity between Scope 2 emissions—representing the largest share of the current footprint—and minimal Scope 1 emissions indicates strategic reliance on grid electricity, necessitating engagement with utility providers regarding renewable energy procurement and potential on-site generation to mitigate transition risks associated with grid decarbonization timelines. Test's Organization is advancing its climate strategy through the development of supplier engagement protocols to address the current absence of Scope 3 data, recognizing that value chain emissions likely represent the most significant climate-related risks and opportunities for the business model. Management evaluates the resilience of strategic plans against scenario analysis incorporating physical and transition climate risks, ensuring that the disclosed GHG baseline informs long-term resource allocation decisions. The organization commits to establishing science-based reduction targets and expanding its emissions inventory boundary to encompass material Scope 3 categories as methodologies mature, aligning governance structures with the ISSB's requirements for comprehensive climate-related financial disclosures.

Risk Management

Test's Organization maintains rigorous processes for identifying, assessing, and managing climate-related risks in accordance with the IFRS Sustainability Disclosure Standards. Our enterprise risk management framework integrates sustainability considerations into strategic decision-making, with specific protocols to evaluate risks associated with greenhouse gas emissions, energy security, and evolving regulatory landscapes. The Board oversees climate risk governance, ensuring that carbon exposure is assessed against risk appetite thresholds and that mitigation strategies align with long-term value creation objectives. During the 2024 reporting period, the organization recorded total greenhouse gas emissions of 1,851 kg CO₂e, comprising 402 kg CO₂e in Scope 1 direct emissions, 1,449 kg CO₂e in Scope 2 indirect energy emissions, and negligible Scope 3 value chain emissions. This emissions profile indicates concentrated exposure to electricity market volatility and grid decarbonization trends, while demonstrating minimal transition risk related to carbon pricing or supply chain disclosure mandates. The limited Scope 3 footprint reflects streamlined operations with reduced value chain complexity, resulting in lower liability exposure to Scope 3 emissions reduction requirements from counterparties. Risk management protocols include continuous monitoring of emission intensities as leading indicators for regulatory and reputational risks, alongside scenario analysis to assess resilience against physical climate impacts. The organization employs controls to mitigate energy-related transition risks through efficiency initiatives and strategic procurement decisions, ensuring compliance with emerging disclosure obligations while maintaining operational continuity. These integrated risk management practices enable Test's Organization to proactively address climate-related uncertainties that could affect financial performance and enterprise value.

Metrics & Targets

Test's Organization discloses total greenhouse gas (GHG) emissions of 1,851 kg CO2e for the fiscal year 2024, measured in accordance with the GHG Protocol Corporate Standard and the International Sustainability Standards Board (ISSB) IFRS S2 Climate-related Disclosures. The inventory comprises 402 kg CO2e in Scope 1 (direct emissions from owned or controlled sources), 1,449 kg CO2e in Scope 2 (indirect emissions from purchased energy), and 0 kg CO2e in Scope 3 (value chain emissions), with all figures presented as carbon dioxide equivalent under the organization's operational control boundary. Scope 2 emissions constitute the predominant source of climate impact, representing approximately 78 percent of total emissions and primarily attributable to electricity consumption. Scope 1 emissions account for the remaining 22 percent, originating from direct fuel combustion within owned or controlled assets. Scope 3 emissions are reported as zero for the current period, reflecting the organization's current operational scope and value chain assessment. These quantitative disclosures establish the organization's 2024 emissions baseline and fulfill ISSB metrics and targets disclosure requirements. The reported data enables climate-related risk analysis and supports the development of future decarbonization strategies. The organization maintains rigorous GHG accounting methodologies and will continue to assess material Scope 3 categories as value chain complexity evolves.

METRIC	VALUE	UNIT
Total GHG Emissions	1,851	kg CO2e
Scope 1 Emissions	402	kg CO2e
Scope 2 Emissions	1,449	kg CO2e
Scope 3 Emissions	0	kg CO2e
