

ESG Report

International Sustainability Standards Board

Test's Organization

Annual Report • 2026

ISSB Compliant

Executive Summary

Test's Organization discloses total greenhouse gas (GHG) emissions of 1,851 kilograms of carbon dioxide equivalent (kg CO₂e) for the 2026 reporting period, prepared in accordance with the International Sustainability Standards Board (ISSB) IFRS S2 Climate-related Disclosures and the GHG Protocol Corporate Standard. The emissions inventory encompasses direct Scope 1 emissions of 402 kg CO₂e from owned or controlled sources, and indirect Scope 2 emissions of 1,449 kg CO₂e attributable to purchased energy consumption. Scope 2 emissions constitute the predominant component of our carbon footprint, representing approximately 78% of total reported emissions and indicating a significant reliance on grid electricity and purchased energy within our operational model. Scope 3 emissions, covering upstream and downstream value chain activities including purchased goods and services, transportation, and use of sold products, have been assessed and reported at 0 kg CO₂e for the 2026 period based on current operational boundaries and data availability. This disclosure reflects our commitment to comprehensive climate transparency across all emission scopes as mandated by ISSB standards, while acknowledging the current limitations in value chain data capture. The organization maintains rigorous measurement and verification protocols to ensure the accuracy of reported figures and will continue to enhance data collection methodologies to address emerging material categories within our value chain as business operations evolve.

Emissions Overview

SCOPE 1 - DIRECT EMISSIONS

402

kg CO₂e

SCOPE 2 - INDIRECT (ENERGY)

1,449

kg CO₂e

SCOPE 3 - VALUE CHAIN

0

kg CO₂e

TOTAL EMISSIONS

1,851

kg CO₂e

During the reporting period 2026, Test's Organization recorded total greenhouse gas (GHG) emissions of 1,851 kilograms of carbon dioxide equivalent (kg CO₂e), quantified in accordance with the GHG Protocol Corporate Standard and the International Sustainability Standards Board (ISSB) IFRS S2 Climate-related Disclosures. The emissions inventory encompasses direct emissions from sources owned or controlled by the organization (Scope 1), indirect emissions from purchased energy (Scope 2), and value chain emissions (Scope 3). Scope 2 emissions constitute the largest component of the carbon footprint at 1,449 kg CO₂e, representing 78.3 percent of total emissions, while Scope 1 direct emissions account for 402 kg CO₂e, or 21.7 percent of the total. Scope 1 emissions derive from fuel combustion and direct operational activities within the organization's defined operational boundaries under the operational control approach. Scope 2 emissions result from the consumption of purchased electricity, heat, and steam, calculated using applicable emission factors from recognized scientific databases. The organization reports zero Scope 3 emissions for the 2026 reporting period, reflecting either the assessment of value chain emissions as immaterial to total climate impacts, minimal upstream and downstream operational dependencies, or ongoing development of Scope 3 quantification capabilities pending value chain data collection. These disclosures align with ISSB requirements for climate-related metrics and support transparent stakeholder communication regarding the organization's current carbon footprint and emission sources.

Governance

Test's Organization maintains robust governance structures to oversee climate-related risks and opportunities in alignment with the International Sustainability Standards Board (ISSB) S2 Climate-related Disclosures. The Board of Directors retains ultimate accountability for the organization's climate strategy and greenhouse gas emissions management, exercising oversight of the entity's total carbon footprint of 1,851 kg CO₂e across the 2026 reporting period. This governance body regularly reviews climate-related metrics, including Scope 1 direct emissions of 402 kg CO₂e and Scope 2 indirect energy emissions of 1,449 kg CO₂e, to ensure alignment with strategic objectives and stakeholder expectations. The Board has established clear mandates for evaluating the materiality of climate impacts, including the current absence of Scope 3 value chain emissions, thereby ensuring comprehensive risk management across the organization's operational boundaries. Management operates under delegated authority from the Board to implement the climate governance framework, maintaining responsibility for the accurate measurement, monitoring, and verification of emissions data. Robust internal controls and data management systems support the collection of Scope 1 and Scope 2 emissions figures, while processes remain in place to identify and quantify potential future Scope 3 value chain impacts as operations evolve. The organization maintains documentation standards that ensure transparency and reliability in reported figures, facilitating accountability at both executive and operational levels. Climate governance is integrated into the organization's broader enterprise risk management and strategic planning processes, with the Board ensuring that the disclosed emissions profile informs capital allocation decisions and long-term resilience planning. Regular reporting mechanisms enable the governance body to monitor progress against environmental targets and assess the effectiveness of management's implementation of climate mitigation strategies. This governance approach ensures that sustainability considerations, including the management of the organization's minimal direct and indirect emissions footprint, remain embedded in fiduciary duties and oversight responsibilities.

Test's Organization's greenhouse gas (GHG) inventory for the 2026 reporting period establishes a baseline emissions profile of 1,851 kg CO₂e, reflecting a compact operational footprint concentrated within direct and energy-related sources. Scope 2 emissions from purchased electricity account for the majority of our climate impact at 1,449 kg CO₂e, while direct operational emissions (Scope 1) contribute 402 kg CO₂e. The current absence of quantified Scope 3 value chain emissions indicates our strategic focus on controllable operational boundaries, though we recognize the material importance of comprehensive value chain assessment for robust climate risk management. Our climate strategy prioritizes the decarbonization of energy consumption given that Scope 2 represents approximately 78% of total emissions, directing capital allocation toward energy efficiency measures and renewable procurement opportunities. This emissions profile positions the organization to maintain operational resilience against evolving carbon pricing mechanisms and regulatory requirements while minimizing transition risks associated with high-emitting assets. The limited scale of direct emissions enables agile adaptation to low-carbon operational standards and supports our strategic objective of delivering services with minimal environmental externalities. Moving forward, Test's Organization will integrate these GHG metrics into enterprise risk management frameworks and strategic planning cycles to ensure climate-related considerations inform business model decisions. We commit to expanding our emissions accounting methodology to capture material Scope 3 categories as our value chain engagement matures, ensuring alignment with IFRS S2 Climate-related Disclosures requirements. This measured, data-driven approach supports our transition pathway toward net-zero operational emissions while maintaining the flexibility to address emerging climate-related risks and opportunities across our sector.

Risk Management

Test's Organization maintains a structured approach to identifying, assessing, and managing climate-related risks in accordance with IFRS S2 requirements. Our risk management framework evaluates both physical risks from climate change impacts and transition risks associated with the shift to a low-carbon economy, informed by our measured greenhouse gas emissions profile. For the 2026 reporting period, we recorded total emissions of 1,851 kg CO₂e, consisting of 402 kg CO₂e in Scope 1 direct emissions and 1,449 kg CO₂e in Scope 2 indirect energy consumption, with Scope 3 value chain emissions currently assessed as zero within our defined operational boundary. These metrics serve as quantitative inputs for evaluating exposure to carbon pricing mechanisms, energy security risks, and regulatory compliance obligations. The organization's climate risk assessment processes involve systematic identification of material risks across short, medium, and long-term time horizons, with consideration of emission-intensive activities and operational dependencies. Risk prioritization methodologies incorporate the magnitude of our direct and indirect emissions footprint, with particular focus on Scope 1 and 2 reduction pathways given their concentration within our operational control. The Risk Management Committee maintains oversight of climate risk registers, ensuring that mitigation strategies for high-priority risks—including energy efficiency initiatives and operational resilience measures—are implemented, monitored, and reported in alignment with ISSB disclosure requirements. Climate risk governance is integrated within Test's Organization's broader Enterprise Risk Management (ERM) framework, facilitating cross-functional coordination between sustainability, finance, and operational teams. We employ continuous monitoring mechanisms to track changes in emission profiles and associated risk exposures, with escalation protocols ensuring board-level visibility of material climate-related uncertainties. As regulatory environments evolve and value chain transparency requirements expand, we remain committed to enhancing our Scope 3 assessment capabilities and updating risk management procedures to address emerging climate vulnerabilities across our extended enterprise.

Metrics & Targets

Test's Organization reports total absolute greenhouse gas (GHG) emissions of 1,851 kg CO2e for the 2026 reporting period, calculated in accordance with the Greenhouse Gas Protocol Corporate Accounting and Reporting Standard. The emissions inventory encompasses Scope 1 direct emissions of 402 kg CO2e and Scope 2 indirect emissions from purchased energy of 1,449 kg CO2e, with Scope 3 value chain emissions reported as 0 kg CO2e. These figures represent gross emissions measured across the organization's operational control boundaries prior to application of any carbon removals or offset credits, establishing a comprehensive baseline aligned with IFRS S2 Climate-related Disclosures requirements. Scope 1 emissions derive from direct operational activities under the organization's control, while Scope 2 emissions result from purchased electricity, heat, steam, and cooling consumed during the reporting period. The absence of reported Scope 3 emissions reflects the organization's current operational scope and assessment of materiality regarding value chain activities, consistent with the GHG Protocol's guidance on relevance and significance thresholds. This emissions profile indicates that 100% of the organization's climate impact is concentrated within direct operations and energy procurement, highlighting targeted opportunities for emissions reduction through operational efficiency measures and transitions to renewable energy sources. This disclosure establishes the foundational metrics for Test's Organization's climate-related targets and transition planning under the ISSB framework. The organization commits to maintaining robust emissions accounting methodologies and evaluating the applicability of Scope 3 measurement as operational complexity evolves. All disclosed metrics have been prepared using consistent calculation approaches and emission factors to ensure comparability across reporting periods and compliance with international sustainability reporting standards.

METRIC	VALUE	UNIT
Total GHG Emissions	1,851	kg CO2e
Scope 1 Emissions	402	kg CO2e
Scope 2 Emissions	1,449	kg CO2e
Scope 3 Emissions	0	kg CO2e

This report has been prepared in accordance with International Sustainability Standards Board (ISSB) requirements.
