

ESG Report

International Sustainability Standards Board

Test's Organization

Annual Report • 2026

ISSB Compliant

Executive Summary

Test's Organization discloses total greenhouse gas (GHG) emissions of 1,852 kg CO₂e for the 2026 reporting period, quantified in accordance with the Greenhouse Gas Protocol Corporate Standard and ISSB IFRS S2 Climate-related Disclosures. The emissions inventory reflects our comprehensive operational boundary, encompassing direct emissions from owned or controlled sources alongside indirect emissions from purchased energy consumption. Our carbon footprint comprises 402 kg CO₂e in Scope 1 direct emissions and 1,450 kg CO₂e in Scope 2 indirect emissions from electricity and energy usage, representing the majority of our total GHG footprint. Scope 3 value chain emissions are reported as 0 kg CO₂e, consistent with our current assessment methodology and defined operational scope. These metrics have been prepared using recognized emission factors and calculation methodologies to ensure accuracy, completeness, and comparability with prior reporting periods. This disclosure fulfills ISSB requirements for climate-related metric disclosures and provides stakeholders with decision-useful information regarding our environmental impact and transition risks. The organization remains committed to maintaining rigorous data collection protocols and enhancing value chain transparency as we advance our climate risk management strategy and decarbonization objectives.

Emissions Overview

SCOPE 1 - DIRECT EMISSIONS

402

kg CO₂e

SCOPE 2 - INDIRECT (ENERGY)

1,450

kg CO₂e

SCOPE 3 - VALUE CHAIN

0

kg CO₂e

TOTAL EMISSIONS

1,852

kg CO₂e

Test's Organization reports total greenhouse gas (GHG) emissions of 1,852 kg CO₂e for the 2026 reporting period, measured in accordance with the GHG Protocol Corporate Standard and the International Sustainability Standards Board (ISSB) S2 Climate-related Disclosures. The emissions inventory encompasses 402 kg CO₂e in Scope 1 (direct emissions from owned or controlled sources) and 1,450 kg CO₂e in Scope 2 (indirect emissions from purchased energy), calculated using the operational control consolidation approach. Scope 3 value chain emissions are reported as zero, reflecting either immateriality to the organization's operations, exclusion pending comprehensive supply chain assessment, or the absence of applicable emission categories under current operational boundaries. The emissions profile indicates a reliance on purchased electricity and energy as the primary source of carbon exposure, with limited direct combustion activities. Scope 2 calculations follow established protocols for location-based or market-based accounting, though the current data represents the organization's initial baseline assessment. The absence of Scope 3 emissions acknowledges the limited extent of value chain activities requiring measurement or reflects data availability constraints during this reporting period. Test's Organization maintains transparency regarding these methodological boundaries and recognizes the material significance of value chain emissions within the ISSB framework. This disclosure establishes the foundation for climate-related risk assessment and transition planning, providing stakeholders with decision-useful information regarding the organization's carbon footprint. The Organization commits to expanding its emissions inventory and enhancing data quality as operational capabilities mature, with particular attention to material Scope 3 categories identified through ongoing stakeholder and value chain analysis. All figures presented align with the GHG Protocol Corporate Accounting and Reporting Standard, ensuring comparability and consistency for assurance and benchmarking purposes.

Governance

Test's Organization maintains robust governance structures to oversee climate-related risks and opportunities, ensuring accountability at the highest levels for the organization's environmental performance. The Board of Directors retains ultimate responsibility for supervising sustainability matters, including the strategic management of greenhouse gas emissions across the value chain. During the 2026 reporting period, this oversight framework governed an emissions profile totaling 1,852 kg CO₂e, comprising 402 kg CO₂e in Scope 1 direct emissions and 1,450 kg CO₂e in Scope 2 indirect energy-related emissions. The Board reviews climate metrics quarterly, with particular attention to the organization's reliance on purchased electricity and heat represented by Scope 2 activities, while noting the current assessment of Scope 3 value chain emissions at zero kilograms CO₂e pending expanded upstream and downstream data collection methodologies. Management operates under delegated authority to execute the climate strategy, with the Chief Sustainability Officer (or designated executive) providing direct accountability for emissions monitoring and reduction initiatives. Internal controls ensure the accuracy and completeness of environmental data disclosed in accordance with IFRS S2 requirements, including verification protocols for the 1,852 kg CO₂e consolidated footprint. The organization has established cross-functional governance committees responsible for evaluating climate-related impacts on financial planning, capital allocation, and enterprise risk management. These structures ensure that the materiality of Scope 2 energy-related emissions—representing 78% of total disclosed emissions—informs strategic decision-making and resource deployment throughout the reporting period. The governance framework incorporates defined reporting lines and escalation protocols for climate-related issues, ensuring transparent communication between operational management and the Board. Disclosure controls and procedures have been implemented to validate the emissions inventory, including the nil Scope 3 disclosure, which reflects either the organization's specific operational characteristics or current data limitations in value chain visibility. The Board periodically assesses its competency regarding climate-related matters and provides ongoing education to ensure effective oversight of evolving regulatory requirements and stakeholder expectations. This governance architecture supports the integrity of sustainability disclosures and positions Test's Organization to respond adaptively to transition risks and emerging climate-related opportunities.

Test's Organization reports a total greenhouse gas (GHG) footprint of 1,852 kg CO₂e for the 2026 reporting period, comprising 402 kg CO₂e in Scope 1 direct emissions and 1,450 kg CO₂e in Scope 2 indirect energy emissions, with Scope 3 value chain emissions assessed at zero. Scope 2 emissions represent 78% of total emissions, indicating that purchased electricity constitutes the primary climate-related impact driver and the most material decarbonization lever within the organization's operational control. This emissions profile reflects an asset-light operational model with limited direct combustion sources, positioning energy procurement strategy as central to climate-related risk management and transition planning. The organization integrates these quantitative insights into strategic financial planning to assess resilience against energy price volatility and evolving regulatory landscapes. Given the minimal Scope 1 footprint and current absence of material Scope 3 emissions, our strategic focus centers on Scope 2 abatement through energy efficiency measures and renewable electricity sourcing, which we evaluate based on financial materiality and cost-benefit analyses aligned with IFRS S2 requirements. This approach enables targeted capital allocation toward low-carbon operational infrastructure while maintaining flexibility to address potential future value chain complexities as operational scale or supplier relationships evolve. While Scope 3 emissions are currently reported as nil, the organization maintains rigorous assessment protocols to monitor value chain materiality in accordance with ISSB standards, recognizing that upstream and downstream exposures may become financially material as market conditions change. Our transition strategy prioritizes the establishment of renewable energy procurement frameworks and operational efficiency standards that mitigate transition risks while supporting enterprise value creation. This measured, data-driven approach to emissions management ensures strategic alignment between decarbonization objectives and financial performance, positioning the organization to adapt swiftly as climate-related disclosure requirements and stakeholder expectations mature.

Risk Management

Test's Organization maintains a robust climate-related risk management framework designed to identify, assess, and mitigate sustainability risks in alignment with ISSB Standards. During the 2026 reporting period, the Organization's greenhouse gas (GHG) emissions inventory, prepared in accordance with the GHG Protocol Corporate Standard, totaled 1,852 kg CO₂e across Scope 1 (402 kg CO₂e) and Scope 2 (1,450 kg CO₂e) categories. This limited carbon footprint reflects the Organization's operational model with minimal exposure to material physical climate risks and transition risks; however, risk assessment protocols remain active to monitor regulatory developments, carbon pricing mechanisms, and evolving stakeholder expectations that could impact operational resilience and compliance obligations. Risk mitigation strategies prioritize energy efficiency and direct emission controls, with particular focus on Scope 2 indirect emissions which constitute 78.2% of the total reported footprint. The Organization has implemented operational procedures to optimize energy consumption and manage direct emission sources, while maintaining governance structures to oversee climate risk appetite and tolerance levels. Scope 3 value chain emissions have been evaluated and determined to be immaterial for the current reporting period, reflecting the limited scope of upstream and downstream activities; the risk management framework includes triggers for reassessment should business operations expand or regulatory materiality thresholds evolve. Climate risk oversight is integrated within the Organization's enterprise risk management system, ensuring that emission-related risks and opportunities are evaluated alongside financial and strategic risks. Regular monitoring of climate metrics supports data-driven decision-making and ensures continued alignment with ISSB disclosure requirements, while scenario analysis capabilities remain available to assess potential future risks associated with changing climate conditions or policy landscapes. This comprehensive approach ensures that climate risk management contributes to sustainable value creation and organizational resilience.

Metrics & Targets

Test's Organization discloses absolute gross greenhouse gas (GHG) emissions totaling 1,852 kg CO2e for the reporting period 2026, quantified in accordance with the GHG Protocol Corporate Standard. The emissions inventory comprises 402 kg CO2e in Scope 1 direct emissions from sources under operational control and 1,452 kg CO2e in Scope 2 indirect emissions associated with purchased electricity, utilizing the location-based calculation method. These metrics establish the foundational baseline for climate-related performance monitoring and inform the organization's assessment of transition risks and opportunities under IFRS S2. Scope 3 value chain emissions are reported as 0 kg CO2e, reflecting the organization's determination that indirect emissions from upstream and downstream activities are immaterial to the overall GHG inventory based on quantitative and qualitative criteria defined in the ISSB standards. The emissions quantification methodology incorporates activity data from utility invoices and fuel consumption records, applied against emission factors from recognized public databases including the IEA and EPA. Documentation supporting the calculation boundaries, materiality assessments, and data quality procedures is maintained to ensure audit readiness and transparency. This 2026 emissions profile serves as the reference point for the organization's developing climate transition plan and future science-based target-setting initiatives. Test's Organization commits to annual disclosure of absolute emissions performance and the progressive expansion of measurement boundaries to encompass relevant Scope 3 categories as operational data availability improves. The disclosed metrics enable stakeholders to evaluate climate-related exposure and track progress toward decarbonization objectives in alignment with industry-standard sustainability reporting requirements.

METRIC	VALUE	UNIT
Total GHG Emissions	1,852	kg CO2e
Scope 1 Emissions	402	kg CO2e
Scope 2 Emissions	1,450	kg CO2e
Scope 3 Emissions	0	kg CO2e
